NetLogo is a multi-agent programmable modeling environment. It is used by many tens of thousands of students, teachers and researchers worldwide. It also powers HubNet participatory simulations. It is authored by Uri Wilensky and developed at the CCL. You can download it free of charge. You can also try it online through NetLogo Web.

Objective:

Define Species-centric agent behaviors

```
;-------------------------------------------------------------------------
; Sawgrass – Cladium jamaicense and Cypress - Taxodium distichum
; Occurs in areas with water continuously aboveground for 6-11 months per year.
; Maximum water depths below 3 ft.
; Cannot survive more than 3 weeks of porewater salinity above 5 psu
; Fire adapted species, resprouts quickly, return interval 2-12 years.
;-------------------------------------------------------------------------
  ask Sawgrass_patches [

    let plants sawgrass-here ; plants agentset of sawgrass on this patch

    if count plants > 0 [
      ; Get patch water depth
      set depth TaylorSlough.stage stage_station - elevation

      ; Accumulate and reset the patch hydroperiod variables
      ifelse depth > 0 [ set days_wet days_wet + 1  set days_dry 0 ]
                       [ set days_dry days_dry + 1  set days_wet 0 ]

      ; Guassian of days_dry to determine death
      ; The range is [0, 365] days, value is N( days_dry, 15 )
      let days_dry_ min ( list 365
                          max ( list 0 random-normal days_dry 15 ) )

      ; Get patch salinity
      set salinity Salinity.psu salinity_station

      ; Accumulate or reset days with salinity above salinity threshold
      ; Note that patch salinity_threshold was set to the initial turtle
      ; salinity_max when the sawgrass was sprouted in sprout-turtles-on-patches
      ifelse salinity >= salinity_threshold[set salinity_days salinity_days + 1]
                                           [set salinity_days 0 ]

      ; Get copy of turtle-context variable salinity_max_days
      let salinity_max_days_ 0
      ask one-of plants [ set salinity_max_days_ salinity_max_days ]

      if depth > 90                        [ necrosis plants "depth > 90"    ]
      if days_dry_ > 180                   [ necrosis plants "days_dry > 180"]
      if salinity_days > salinity_max_days_ [ necrosis plants "salinity_days" ]

  ]
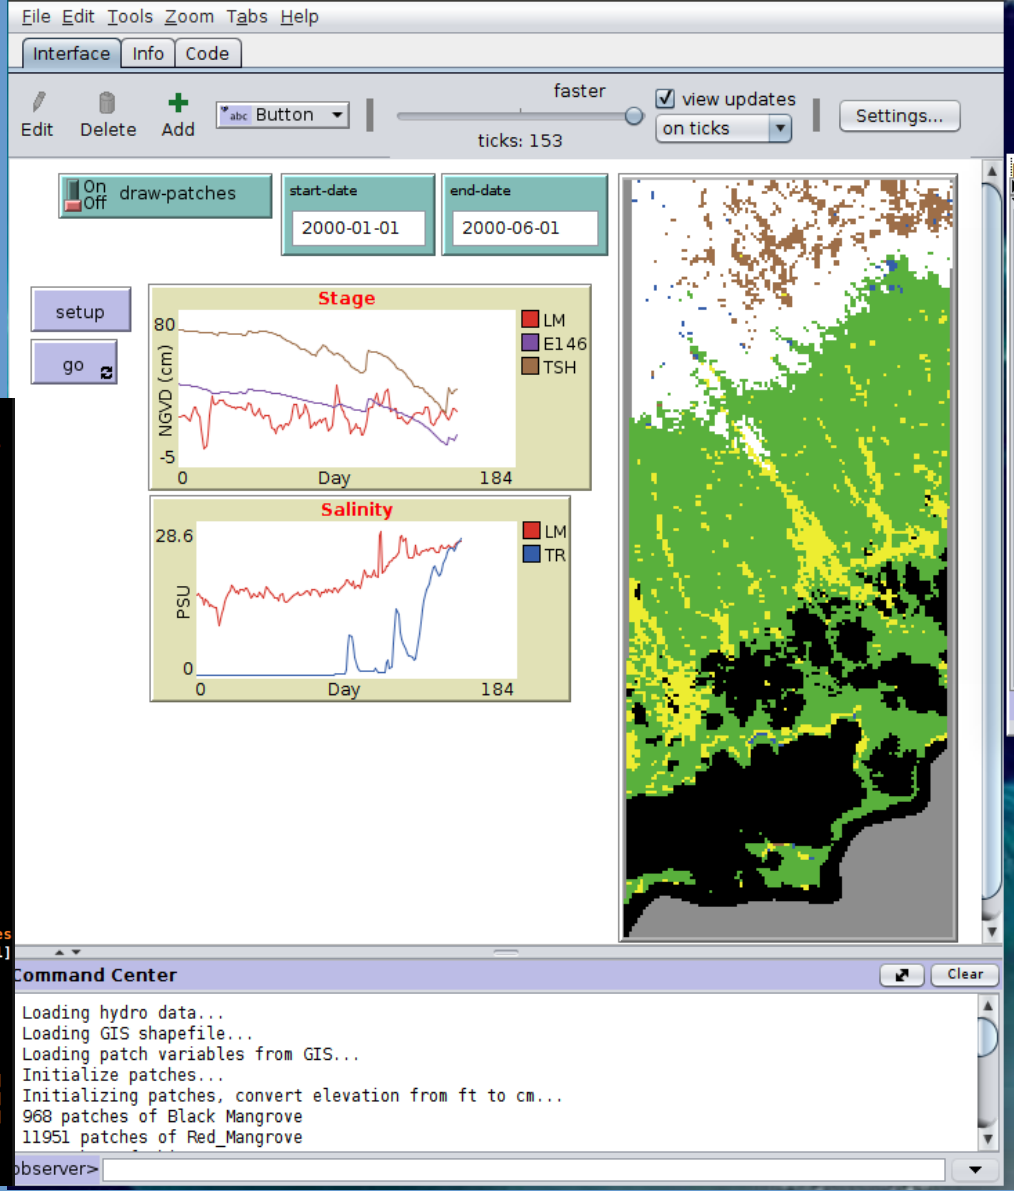
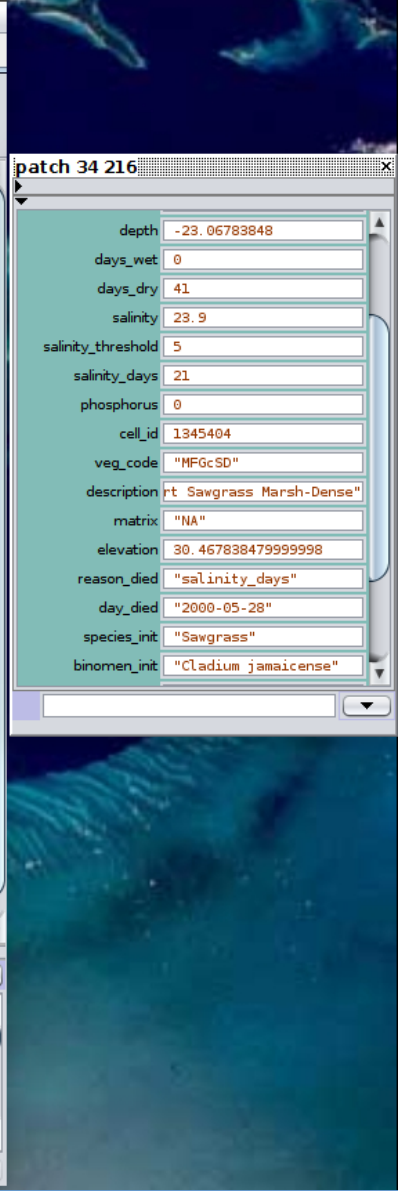
end
```





Objectives

I. MOI / Landsat synthesis & analysis.
J Park J Redwine …. …. ….

II. Develop & Define Species and Patch agent behaviors.
J Park J Redwine …. …. ….

III. Review Everglades Landscape Vegetation Succession (ELVeS) model for probabilistic agent behaviors.
J Park J Redwine …. …. ….

IV. Collaborate on extension and development of MOI/Landsat dynamics into temporal ‘snapshot’ vegetation maps for ABM ‘calibration’.
J Park J Redwine …. …. ….

V. Advocate Vegetation Map ingestion into Relational DB (Data4EVER).
